Introduction

The PerkinElmer PGA pulsed laser family consists of hermetically packaged devices having up to four active lasing layers, which are epitaxially grown on a single GaAs substrate chip. This multi-layer design multiplies the output power by the number of epi-layers. For example, the QPGA quad laser at 225 µm active layer width which has four epitaxially grown lasing layers, delivers an output peak power >100 W and, by additionally stacking three quad chips into a single package, the usable device power even exceeds 300 W.

The laser chips of the PGA family feature stripe widths of 75 and 225 µm and come as single (PGA), double (DPGA), triple (TPGA), or quadruple (QPGA) epi-layer version, which in addition can be stacked to increase the output power further.

The PGA series possesses a 25º beam divergence in the direction perpendicular to chip surface and a 10º beam spread within the junction plane. The power output shows an excellent stability over the full MIL specification temperature range. Structures are fabricated using metal organic chemical vapour deposition (MOCVD).

Recognizing that different applications require different packages, six standard package options are available, including the traditional stud designs as well as 5.6 and 9 mm CD packages and ceramic substrates. Since pulse widths in applications have decreased and optical coupling has become even more important, the newer packages – boasting reduced inductance and thinner, flatter windows – have gained popularity.

Additionally where fiber coupling applications are concerned, the transverse spacing of the EPI cavity active areas concentrates more optical power into a smaller geometry allowing for increased optical power coupling into optical fibers.

Features and Benefits

- Doubling, tripling or quadrupling of the output power from a single EPI-cavity chip with a small active area: Peak power exceeds 100 W at 30 A drive current and 100 ns pulse width.
- Peak power >300 W at 30 A drive current and 100 ns pulse width for 3 physically stacked quad EPI-cavity chips.
- Extremely high reliability.
- The PGA EPI-cavity lasers family has been proven in safety applications since early 1990s.
- Range of single element and stacked devices.
- Choice of 6 standard packages.
- 80% power retention at 85ºC ambient.
- Flexibility in customization for different applications.
- Small emitting areas allow ease of fiber coupling.
- RoHS compliant

Applications

- Laser range finding.
- Laser safety curtains (laser scanning).
- Infrared night illumination
- Laser speed measurement (LIDAR).
- Automotive adaptive cruise control (ACC).
- Material excitation in medical and other analytical applications.
- Weapon simulation.
PGA Pulsed Laser Family Selection Table

The following table lists the preferred chip and stacking options. For other configurations please inquire.

Operating Conditions

The laser is operated by pulsing in the forward bias direction.

The PerkinElmer warranty applies only to devices operated within the maximum rating, as specified. Exceeding these conditions is likely to cause permanent “burn off” damage to the laser facet and consequently a significant reduction in optical power.

Operating the devices at increased duty cycles will ultimately and irreparably damage the crystal structure due to internal heating effects. Diodes are static sensitive and suitable precautions should be taken when removing the units from their antistatic containers. Circuits should be designed to protect the diodes from high current and reverse voltage transients. Voltages exceeding the reverse breakdown of the semiconductor junction are particularly damaging and have been shown to cause degradation of power output. Although the devices will continue to perform well at elevated temperatures for some thousands of hours, defect mechanisms are accelerated.

Optimum long term reliability will be attained with the semiconductor at or below room temperature. Adequate heat sinking should be employed, particularly for the larger stacks and when operated at maximum duty factor.

Forward Voltage

The forward voltage of the device is a combination of: a static voltage drop resulting from band gaps and material characteristics, a dynamic series resistance resulting from the contact area dimensions, the resistivity of the contact layers, and the inductive voltage drop of the package. Voltages due to the inductive elements are additional and, therefore, are considered separately since they depend on the package inductance, the pulse rise time and the peak current.

Package Inductance

When narrow pulse widths are required, the system designer must take care that circuit inductance is kept to a minimum (note inductance on package list). Using the lower inductance packages will reduce the peak voltage required to obtain the desired drive current.

For example, to obtain approximate Gaussian pulse shapes for the “C” and “U” packages:
1. DPGAC1S12H:
\[ t_w = 40 \text{ ns} \quad P_r = 25 \text{ kHz}, \quad t_r = 20 \text{ ns}, \]
\[ i_r = 60 \text{ A}, \quad L_{CPKG} = 12 \text{ nH} \]
\[ V_{PKG} = 12 \times 10^{-9} \times 60/20 \times 10^{-9} = 36 \text{ V} \]

2. DPGAU1S12H:
\[ t_w = 40 \text{ ns} \quad P_r = 25 \text{ kHz}, \quad t_r = 20 \text{ ns}, \]
\[ i_r = 60 \text{ A}, \quad L_{CPKG} = 5 \text{ nH} \]
\[ V_{PKG} = 5 \times 10^{-9} \times 60/20 \times 10^{-9} = 15 \text{ V} \]

Note: These voltage drops are merely to overcome the inductance of the package and do not include the series package and chip static resistances.

Other circuit elements typically increase voltage requirements to \( 3 \times V_{PKG} \), therefore the location of components to minimize lead length is critical.

For Your Safety

Laser Radiation: Under operation, these devices produce invisible electromagnetic radiation that may be harmful to the human eye.

To ensure that these laser components meet the requirements of Class IIIb laser products, they must not be operated outside their maximum ratings. Power supplies used with these components must be such that the maximum peak forward current cannot be exceeded. It is feasible to operate the diodes within Class I laser operation, but it is the responsibility of the user incorporating a laser into a system to certify the Class of use and ensure that it meets the requirements of the DHHS or appropriate authority.

Further details may be obtained in the publication FDA 88-8035: US Department of Health and Human Services Food and Drug Administration Center for Devices and Radiological Health 1390 Picard Drive Rockville, MD 20850 U.S.A.

PerkinElmer has used the data in the above document to calculate “Accessible Emission Limits” in terms of radiation power output and plotted them against pulse width for 850 nm and 1500 nm lasers. Ask for Technical Report “A Comparison of the Accessible Emission Limits (AEL’s) for Laser Radiation at 850 nm and 1500 nm”.

Ordering Information

The “preferred package” options on the list will normally be offered at lower cost and with shorter delivery times. To keep the costs down the standard devices are tested and burned-in under standard conditions.

While the devices are warranted over the entire specification, for a quantity purchase, customers are advised to discuss their requirements in advance so that any special test needs can be accommodated and yields optimized.

PerkinElmer has been routinely supplying multi active EPI-cavity lasers for military applications since the early 1990s. These diodes benefit from long years of experience from screened laser diodes to European and North American military specifications. Though the commercial products are not continuously screened, they are designed to meet demanding environmental conditions.

Typical qualification of these parts would include:

- High Temperature Storage
- Hermetic Seal
- Thermal Shock
- Random Vibration
- Acceleration
- Mechanical Shock
RoHS Compliance

This series of laser diodes are designed and built to be fully compliant with the European Union Directive 2002/95/EC – Restriction of the use of certain Hazardous Substances in Electrical and Electronic equipment.
