**PACKAGING:** 1 mCi/ml (37 MBq/ml) in ethanol:water (1:1), in a silanized vial. Shipped in dry ice.

**STABILITY AND STORAGE RECOMMENDATIONS:**

When adenosine 3', 5'-cyclic phosphate, ammonium salt, [2,8-^3^H]- is stored at -20°C in its original solvent and at its original concentration, the rate of decomposition is initially less than 3% per year from date of purification. Stability is nonlinear and not correlated to isotope half-life. Lot to lot variation may occur.

- Ethanol is employed to reduce the rate of decomposition. If it is necessary to store aqueous solutions of this compound, the solution should be rapidly frozen by rotating the vessel in a dry-ice acetone bath.

**SPECIFIC ACTIVITY RANGE:** 25-40 Ci/mmol (925-1480 GBq/mmol)

**RADIOCHEMICAL PURITY:** This product was initially found to be greater than 97% when determined by the following methods. The rate of decomposition can accelerate. It is advisable to check purity prior to use:

- High pressure liquid chromatography on Zorbax ODS column using the following mobile phase:
  0.02M formic acid : acetonitrile, (98:2).
- Paper chromatography on Whatman No. 1 using the following solvent system:
  isopropanol : ammonium hydroxide : water, (7:1:2), DESCENDING.

**CHEMICAL PURITY:** Determined by ultraviolet spectrophotometry at pH 7.0 in 0.05M potassium phosphate buffer. Values observed fall into the published range of absorbency ratios for adenosine-5'-monophosphate. (1)

Incubation of this product with 3', 5'-cyclic nucleotide phosphodiesterase from beef heart was found to give greater than 95% conversion to 5'-AMP [2,8-^3^H] as determined by high pressure liquid chromatography.
QUALITY CONTROL: The radiochemical purity of adenosine 3', 5'-cyclic phosphate, ammonium salt, [2,8-3H]- is checked at appropriate intervals using the first listed chromatography method.

TRITIUM NMR: The position of label and relative distribution has been investigated by tritium NMR

SPECIAL INFORMATION:

Removal of solvent: An aliquot or the entire sample can be taken to dryness by directing a gentle stream of inert gas (nitrogen) over the surface of the solution. The temperature of the solution should not be allowed to exceed 20°C during the drying process, and the compound should not be permitted to remain in the solid state any longer than necessary. For additional information regarding stability and storage, see discussion above.

HAZARD INFORMATION: WARNING: This product contains a chemical known to the state of California to cause cancer.
