Important disposal information
The Lysis Buffer (5X) in this kit contains Triton X-100, otherwise known as p-tert-octylphenol ethoxylate.
p-tert-octylphenol ethoxylate must be disposed of as Controlled Waste in accordance with Local Regulations.
General Information on the AlphaScreen® SureFire® c-Jun p-Ser63 assay

The AlphaScreen® SureFire® c-Jun p-Ser63 assay is used to measure the phosphorylation of endogenous c-Jun in cellular lysates. The assay is an ideal system for the screening agents acting intracellularly, such as small molecule inhibitors of upstream events, and can be applied to primary cells.

This assay eliminates the need for laborious techniques, such as Western blotting or conventional ELISA. It is a homogeneous assay, in that no sample washing steps are required, which allows for minimal handling, short assay times, and robotic operation if desired. The assay utilizes the bead-based Alpha Technology, and requires an Alpha Technology-compatible plate reader.

Alpha Technology AlphaScreen® SureFire® Assay Principle

AlphaScreen® SureFire® technology allows the detection of phosphorylated proteins in cellular lysates in a highly sensitive, quantitative and user friendly assay. In these assays, sandwich antibody complexes, which are only formed in the presence of analyte, are captured by AlphaScreen donor and acceptor beads, bringing them into close proximity. The excitation of the donor bead provokes the release of singlet oxygen molecules that triggers a cascade of energy transfer in the Acceptor beads, resulting in the emission of light at 520-620nm.

Kit-Specificity information

This assay kit contains antibodies which recognize the phospho-Ser63 epitope, and a distal epitope, on JUN oncogene (c-Jun). The protein detected by this kit correspond to GenBank Accession NP_002219. c-Jun is also known as AP1, AP-1, and JUN.

These antibodies recognize c-Jun of human, mouse and rat origin. Other species should be tested on a case-by-case basis.

**Storage conditions upon receipt**
The kit buffers e.g. 5X Lysis buffer, Activation buffer and Reaction buffer should be stored at 4°C. **DO NOT** freeze the kit buffers – the Reaction buffer contains antibodies and freeze/thaw cycles can lead to a loss of activity.

**Materials Required But Not Provided**
The AlphaScreen SureFire assay kits are optimized to work with AlphaScreen Protein A general IgG detection beads. These are available separately from PerkinElmer. The AlphaScreen Protein A general IgG detection kits contain a biotinylated rabbit IgG control, which can be used to test the instrument settings and bead performance.

</table>

* Do not vortex the Reaction buffer, as vigorous mixing can damage some antibodies.
** Prepare and use Donor Mix under low-light conditions.

Control Lysate information

Control lysates are prepared from confluent flasks of NIH/3T3 cells (ATCC #CRL-1658) at a concentration of approximately 1 mg/mL. The controls are supplied lyophilized, and should be reconstituted in either dd H₂O or MilliQ® H₂O. Once reconstituted, lysates should be stored frozen in single use aliquots.

Negative Lysate: Prepared from flasks of confluent NIH/3T3 cells.

Positive Lysate: Prepared from NIH/3T3 cells treated with 500 ng/mL anisomycin for 30 minutes.
c-Jun p-Ser63 AlphaScreen® SureFire® Assay Protocols

A. 2-Plate Assay - assay protocol for adherent cells

**Cell Seeding**
1. Seed cells (200 μL of cells for 96 well plates, 50 μL for 384 well plates) in tissue culture plates. Incubate at 37°C overnight in serum-containing media.

**Cell Treatment**
2. Remove culture media, and stimulate the cells with 50 μL agonists prepared in serum-free media (25 μL for 384-well plates). (If testing antagonists, prior to stimulation remove culture medium and replace with 50 μL serum-free media containing antagonists (25 μL for 384-well plates)). Return cells to 37°C incubator for desired time. 1 hour is often sufficient for signal transduction inhibitors, and 5 minutes for receptor agonists.

**Note:** Peptidic agonists and antagonists can often stick to plastic surfaces. To minimize this effect, dilute in serum-free media containing a suitable carrier protein (e.g. 0.1% IgG free BSA - Jackson ImmunoResearch Cat #001-000-161).

**Lysate Preparation**
5. To lyse cells, remove medium from wells, and add freshly prepared 1X Lysis Buffer (50-100 μL for a 96 well plate, 25 μL for a 384 well plate). Agitate on a plate shaker (~350 rpm) for 10 minutes at room temperature.

6. Take 4 μL of the lysate and transfer to a 384-well Proxiplate™ for assay. (Add 4 μL Control lysates to separate wells if required).

**SureFire Assay**
7. Add 5 μL of Acceptor Mix to wells. Seal plate with Topseal-A adhesive film, and incubate for 2 hours at room temperature.

8. Add 2 μL of Donor Mix to wells under subdued light. Seal plate with Topseal-A adhesive film, and cover plate with foil. Incubate for 2 hours at room temperature.

**Note:** Longer incubation may give greater sensitivity. Plates can be incubated overnight if required.

9. Read plate on an Alpha Technology-compatible plate reader, using standard AlphaScreen settings.
B. 1 Plate Assay - assay protocol for non-adherent cells, and for high-throughput applications.

Note: the larger volumes required using this assay will result in achieving less assay points per kit.

Cell Seeding
1. Harvest cells by centrifugation, and re-suspend cells in HBSS at a suitable cell density. We recommend 10^7 cells/mL as a starting point. Seed 4 μL of cells/well into a 384-well culture plate.

2. If using test agents/inhibitors, add 2 μL/well of 4X inhibitors prepared in HBSS.

Note: Peptidic agonists and antagonists can often stick to plastic surfaces. To minimize this effect, dilute in serum-free media containing a suitable carrier protein (e.g. 0.1% IgG free BSA - Jackson Immunoresearch Cat #001-000-161).

3. Return cells to incubator at 37°C for 1-2 hours.

Cell Treatment
4. Stimulate cells with agonists by addition of 2 μL/well of 4X agonist stock in HBSS containing 0.1% BSA. The final volume in the wells should be 8 μL. (If no antagonists were used in step 2, stimulate the cells with 4 μL/well of 2X agonist, to give a final volume in the wells of 8 μL.)

Lysate Preparation
5. To lyse the cells, add 2 μL/well 5X Lysis buffer. (Add 10 μL control lysates to separate wells if required)

SureFire Assay
6. Add 8 μL of Acceptor Mix to wells. Seal plate with Topseal-A adhesive film, and incubate for 2 hours at room temperature.

7. Add 3 μL of Donor Mix to wells under subdued light. Seal plate with Topseal-A adhesive film, and cover plate with foil. Incubate for 2 hours at room temperature.

Note: Longer incubation may give greater sensitivity. Plates can be incubated overnight if required.

8. Read plate on an Alpha Technology-compatible plate reader, using standard AlphaScreen settings.
Representative Data

T75 flasks of confluent NIH/3T3 cells were serum-starved overnight, then treated for 30 minutes with anisomycin (+), or left unstimulated (-). The flasks were lysed in 2 mL, and analyzed by Western blot for either total c-Jun (left) or c-Jun p-Ser63 (right).

NIH/3T3 cells were seeded at 20K/well into 96-well microplates, in media containing 10% FBS and cultured overnight. The following day the media was removed and the cells were serum-starved for a further 24 hours. The cells were then stimulated with various concentrations of anisomycin for 30 minutes. The media was removed and the cells were lysed with 50 μL of freshly prepared 1X Lysis buffer, with gentle shaking for 10 minutes. The lysate was analyzed for c-Jun phospho-Ser73 using the standard AlphaScreen SureFire 2-plate protocol.
